

ABSTRACT OF THE DISCLOSURE

A digital camera in which two recording media such as memory cards may be mounted, wherein when an image 211 is
5 reproduced in the monitor 21 on the rear side of the camera, the card name 212 for the memory card in which the data for the image 211 is recorded, as well as the image number 213, are also displayed. Further, by deeming the first image data item in the other memory card as the image data item
10 following the last image data item in one memory card, all image data items recorded in both memory cards are handled as if they were recorded in a single large-capacity memory card. Consequently, the user may easily determine the memory card from which the displayed image was read, and at
15 the same time, erroneous operation may be prevented, and accurate handling of the image data may be realized.
